

Delivering SAP Security implementation solutions

At Turnkey Consulting we have extensive experience in all aspects of the design and implementation of SAP Security solutions:

Role Design

Turnkey Consulting has a complete end-to-end SAP security delivery capacity with deep experience in SAP security design and the use of SAP configuration tools.

SAP roles can be designed and developed in a number of different ways. The right design for your implementation will be dependent on a number of factors including the number of users, the organisational structure, the company's approach to risk etc...

We are able to draw on experience from multiple SAP security implementations to recommend, develop and implement the most appropriate solution for your implementation.

Technical Configuration

We have a unique methodology for the implementation of SAP security, KeyMethod.

At Turnkey Consulting we have extensive experience in the use of all the SAP Security configuration tools available. Our consultants use best practice techniques to develop a SAP Security solution that:

- is simple to understand.
- is easy to maintain.
- exceeds audit and compliance requirements.

Continuous involvement of client staff throughout the project ensures that post go-live you have the necessary in-house skills to maintain your solution going forwards.

Security Testing

Our network of SAP security consultants is extensive and covers all modules and industry sectors.

Thorough testing of a SAP security solution is essential for a successful implementation. The KeyMethod methodology incorporates design and build reviews in addition to the standard unit, integration and user acceptance test phases.

Our consultants are fully aware of the importance of security testing and will work throughout the project to ensure that role testing takes place at the right stages of the project.

Where required we can also provide experienced security testing resources as well as an outsourced testing service to save project costs.
